Re: Impact due to Japan Earthquake

Dear Customer,

Please be assured that LSI is working with its suppliers to understand the impact that this latest natural disaster in Japan on its supply chain.

LSI's foundry partners are reporting no impacts to it operations, these are centered outside of Japan.

As for our backend Contract Manufacturer operations, none of LSI's products are directly manufactured in Japan. However, we are requesting that all our product suppliers (Amkor, SPIL, KYEC and Stats ChipPAC) assess the impact on their BOM supply chains which are sourced in Japan (certain substrates, mold compound, solder balls etc) and the impact on their suppliers' supply chain, as well as the status of all logistical routes. We have heard from one major supplier that their material suppliers have not been affected; however we do anticipate a temporary impact on their shipments being transported through their regional airports. All our suppliers have committed to contact LSI on Monday with an assessment of their inbound supply in order to determine any potential impacts to LSI.

For deliveries to our customers in Japan, we anticipate some delay in the delivery schedules. The DHL network flights have resumed but there has been some damage which is restricting pickup and delivery to eastern regions (NRT/TYO/OH) while western operations (KIX/NGO) have resumed operations.

We will provide an update when we have further information to share. Please contact your local Customer Service contact for further details should have any questions.

Sincerely,

LSI Corporation
